

Mic / DSP Tab Guide

Use the Mic / DSP tab to select a microphone, tune EQ, shape the voice chain, and verify the processed signal.

Control	Purpose
Strip / Microphone / Input	Choose the edited mic channel and interface lane.
Spectrum / 3D Wave	Switch between tone analysis and motion view.
EQ bands	Shape voice frequencies with per-band bypass.
Processing modules	Tune cleanup, tone, dynamics, and effects.
Presets	Load or save repeatable voice chains.

Mic selection

- Choose the strip, microphone, and input channel at the top of the tab.
- ASIO interfaces appear as ASIO inputs and keep their driver identity for restart and restore paths.
- System and app loopback sources are managed from the Mixing tab, keeping the mic editor focused on real mic inputs.

Visual analysis

- Spectrum mode shows the detailed processed response for EQ and tone decisions.
- 3D Wave mode shows the rolling GPU-backed waterfall for motion and stability checks.
- The Lines control changes how densely the waterfall interpolates history rows.

EQ and processing

- The faceplate EQ provides direct band gain control with per-band bypass.
- Processing modules cover filtering, gates, expansion, suppression, compression, de-essing, saturation, limiting, and NAudio effects.
- Preset buttons and user presets give quick starting points while preserving detailed controls.

Practical tuning order

- Start with input trim and high-pass filtering before heavy dynamics.
- Use gate and expander settings to control room noise before compression.
- Use limiter and makeup gain last so the processed output remains controlled.

Tip: keep this guide near the matching tab. The Help menu opens one focused PDF per tab so the live workflow stays easy to scan.
