

MIDI Tab Guide

Use the MIDI tab for device checks, message monitoring, file playback tests, SoundFont inspection, and control mappings. Enable it from File when needed.

Control	Purpose
File > Enable MIDI	Shows or hides the MIDI tab.
Input Start / Stop	Monitor incoming MIDI messages.
Output Open / Close	Prepare a MIDI destination.
MIDI file test	Play a MIDI file through the selected output.
Control mappings	Bind incoming MIDI messages to mixer actions.

Enable MIDI

- The MIDI tab is hidden by default so church audio workflows stay focused.
- Open File and check Enable MIDI to show the tab, refresh MIDI devices, and enable MIDI help.
- Unchecking Enable MIDI stops the MIDI monitor and output port, then hides the tab again.

Device check

- Select an input device and press Start to monitor incoming MIDI messages.
- Select an output device and press Open before sending notes, controller changes, patch changes, pitch wheel, raw bytes, or sysex.
- Panic, All Notes Off, and Reset CCs help recover stuck notes or controllers.

MIDI file test

- Open a MIDI file to inspect tracks and create a tempo-aware playback plan.
- Play sends the file events to the opened MIDI output at the chosen speed.
- Export creates a copy of the selected MIDI file for testing or handoff.

SoundFont and mappings

- Load a SoundFont to inspect presets, instruments, and samples.
- Preview sends notes through the current MIDI output or previews individual samples locally.
- Control mappings connect incoming MIDI messages to live mixer actions.

Tip: keep this guide near the matching tab. The Help menu opens one focused PDF per tab so the live workflow stays easy to scan.
