

Mixing Tab Guide

Use the Mixing tab as the live desk for mic strips, program mix, output routing, app mix control, and standalone recordings.

Control	Purpose
Channel strips	Operate mics and loopback sources as a live desk.
Selected Input	Adjust the active strip in detail.
Send Program Mix	Route the master bus to an output or virtual cable.
Recording source	Pick program, selected mic, or raw backup.
CoreAudio App Mix	Manage Windows app sessions on non-ASIO outputs.

Live mix

- Channel strips show selected mics, loopback sources, and signal meters across the program bus.
- Mute, solo, gain, pan, polarity, delay, and volume controls shape each input before the master mix.
- The selected input panel gives detailed control over the active strip without switching back to Mic / DSP.

Program output

- Send Program Mix routes the final mix to the selected output device or virtual cable.
- ASIO output is opt-in through the selected ASIO output device and bypasses Windows CoreAudio app-session controls.
- The output panel shows peak, RMS, limiter reduction, feedback risk, and active route details.

Recording

- Standalone recording captures the program mix, selected mic, or selected raw mic backup.
- Saved files can be played, exported, opened, or deleted from the recording list.
- The recording source selector controls whether the file matches the program bus or a selected mic path.

CoreAudio app mix

- The app mix panel lists Windows sessions on the selected output device when CoreAudio exposes them.
- ASIO outputs do not expose app sessions, so use ASIO driver controls or the physical interface mixer for those routes.

Tip: keep this guide near the matching tab. The Help menu opens one focused PDF per tab so the live workflow stays easy to scan.
