

Podcast Tab Guide

Use the Podcast tab for camera preview, session recording, camera profiles, recording health, and saved session playback.

Control	Purpose
Camera / Mode	Select the video source and capture format.
Camera On	Starts or stops preview capture.
REC / Pause / Stop	Controls the podcast recording session.
Camera profiles	Save and restore repeatable camera setups.
Saved Recordings	Review completed sessions and file locations.

Primary workflow

- Choose a camera and mode in the top bar, then use Camera On when the session needs preview or video capture.
- Press REC to create a dated session folder and start the podcast recording transport.
- Use Pause and Stop from the transport strip to control the active session.
- Saved sessions appear in the right rail so you can play, inspect, open, or delete a completed take.

Audio confidence

- The Audio Confidence panel shows whether the processed DSP signal is active for the session.
- The compact waterfall confirms that live audio is flowing into the program mix.
- Recording health summarizes audio, preview, and camera pipeline status during a take.

Camera setup

- Camera profiles save camera choice, mode, denoise, color polish, and advanced camera settings.
- Advanced camera controls expose driver-level options such as focus, exposure, and white balance when Windows provides them.
- Safe start disables camera auto-start after an unclean shutdown so you can recover devices deliberately.

Session files

- Each podcast recording creates its own folder with session metadata and media outputs.
- The save location picker controls where new session folders are created.
- Session playback uses the preview area so finished recordings can be checked without leaving Jericho Down.

Tip: keep this guide near the matching tab. The Help menu opens one focused PDF per tab so the live workflow stays easy to scan.
