

Jericho Down Tabs and Features Guide

A map of the main screens, what each tab is for, and where to go first for common church production jobs.

Quick Map

Tab	Purpose	Use It For
Podcast	Video/audio recording workspace with camera preview, recording transport, session files, camera profiles, and video polish.	Recording sermons, podcasts, testimony clips, or camera-based sessions.
Mic / DSP	Per-microphone source selection, input level, presets, EQ sliders, DSP processing, spectrum, and 3D waveform.	Making one mic sound clear before it reaches the mixer.
Mixing	Combines processed mic channels and app audio into the final program mix for output or recording.	Balancing multiple microphones, routing the program mix, and recording final audio.
MIDI	Utility tab for MIDI input/output checks, live monitor, mappings, MIDI file tests, SoundFont inspection, and message sending.	Testing keyboards/controllers and future worship MIDI workflows.
Karaoke	Backing-track playback, queueing, lyrics display, key/tempo tools, vocal monitoring, camera preview, and karaoke recording.	Practice, worship lyrics, backing tracks, and recorded vocal sessions.

Common Jobs

Need	Go Here First
Make one mic sound better	Mic / DSP, then use Help -> Equalizer for tone and DSP guidance.
Balance several mics	Mixing, then use Help -> Mixer for faders, solo, pan, delay, output, and recording.
Record a camera session	Podcast. Choose camera, output folder, and recording options before pressing REC.
Sing with a backing track	Karaoke. Add tracks, load or detect lyrics, set key/tempo, then record if needed.
Test a keyboard or MIDI controller	MIDI. Start with Device Check and Live Monitor.
Prove DSP behavior	Help -> About -> Verification. Run the checks and save the report.

Podcast Tab

Feature	What It Does
Top camera controls	Choose the camera and mode, then turn camera preview on or off.
REC / Pause / Stop	Runs the main podcast recording session and timer.
Video preview	Shows the selected camera or playback preview.
Audio Confidence	Shows processed signal activity and recording health.
Camera profiles	Save and reload camera setups.
Record processed audio	Stores the EQ/DSP version of the mic in the recording.
Color polish and denoise	Lightly improves camera image and reduces low-light grain.
Recording location and saved recordings	Chooses where sessions go and lets you play, inspect, or delete saved sessions.

Mic / DSP Tab

Feature	What It Does
Strip selector	Chooses which mic strip you are editing.
Mic and channel selectors	Choose the device and real input channel for that strip.
Spectrum / 3D Wave	Shows the selected mic only, so you can see the sound you are adjusting.
Input Level	Confirms the mic is receiving signal before you shape it.
Presets and user presets	Load built-in voice starting points or save your own.
EQ sliders and voice zones	Shape tone by frequency: rumble, warmth, mud, box/nasal, presence, sibilance, and air.
Jericho DSP	Custom voice tools such as high-pass, de-popper, gate, compressor, de-esser, warmth, and limiter.
NAudio family	Optional NAudio effects and experiments. Jericho verification focuses on the custom Jericho DSP.

Mixing Tab

The Mixing tab has its own dedicated guide under Help -> Mixer. In short, it combines processed inputs into the final program mix and controls output routing and standalone recording.

Area	What It Does	When To Touch It
Master bar	Controls the final program mix level, stereo/mono mode, auto normalize, limiter, and limiter ceiling.	Use it after the individual mics feel balanced. Keep limiter on for safety.
Output spectrum	Shows the program mix frequency shape.	Use it to see low rumble, harsh peaks, or missing presence in the final mix.
Program output 3D	Shows the final output as a GPU-backed rolling 3D waveform.	Use it as a confidence view that the program mix is alive and moving.
Channel strips	Each vertical strip represents one mixer input with name, route, mute, fader, meter, and clip light.	Use these for normal live mixing. Rename mics so they make sense at a glance.
Selected Input panel	Detailed tools for the selected strip: sync, meter, mute, solo, invert, reset, input gain, pan, and delay.	Use it when one input needs more than a simple fader move.
Output Routing	Chooses where the program mix is sent and shows actual routing, meters, limiter reduction, and feedback risk.	Use it before feeding speakers, headphones, a virtual cable, or another app.
Recording	Records program mix, selected processed mic, or selected raw backup.	Use program mix for the finished service. Use raw backup when you want rescue audio.
CoreAudio App Mix	Shows app sessions on the selected output with app-level mute, volume, and activity meters.	Use it when a music player, browser, or other app is too loud or should be muted.

MIDI Tab

Feature	What It Does
Device Check	Select MIDI input and output devices and open/close them safely.
Live Monitor	Shows incoming MIDI messages so you can confirm the controller is talking.
Utility Mapping	Maps selected MIDI messages to app actions.
MIDI File Test	Loads, plays, exports, and tempo-tests MIDI files.
SoundFont Inspector	Loads SF2 files, inspects presets, instruments, and samples, and sends preview notes.
Message Sender	Sends test notes and controller messages to the selected MIDI output.

Karaoke Tab

Feature	What It Does
Songs on Disk	Browse music folders, add selected tracks, and build a queue.
Playback controls	Play, stop, seek, and see current/duration time.
Lyrics display	Shows current and upcoming lyric lines during playback.
Lyrics tools	Load lyrics, auto-time text, detect lyrics locally when tools are installed, or clear lyrics.
Key and tempo	Move the backing track pitch or speed for the singer.
Reduce Lead Vocal	Helps push the original lead vocal down when practicing with commercial tracks.
Camera Preview and Record Video	Preview camera while singing and optionally record video.
Live Vocal Monitor	Sends processed vocal audio to a selected monitoring output.
Karaoke Recording	Records vocals with the backing track workflow and manages saved files.

Help Menu

Use Help -> Equalizer for presets, EQ zones, and DSP controls. Use Help -> Mixer for program mix routing, recording, meters, and per-channel mixer tools. Use Help -> About -> Verification to prove the custom Jericho DSP checks pass in the current build.
